Professional Summary

Full-stack Software Engineer with 4+ years designing and maintaining front-end and back-end systems and automating manual workflows (.NET/C#, Python, SQL Server) across startup and corporate environments; translates requirements into actionable roadmaps and ships iteratively in Scrum/Kanban.

Key Skills:

- Workflow Automation
- Front-end Design
- Authentication & Connectivity
- System Integration
- Back-end APIs
- Observability & Monitoring
- Diagnostic Troubleshooting
- Data Engineering

Languages: C#, Python, SQL, JavaScript/TypeScript, Java, C++, R

Frameworks: ASP.NET Core (Web API, MVC), Entity Framework Core, Angular, WPF (MVVM), Node.js/Express

Data: SQL Server, Oracle, PostgreSQL, MongoDB; pandas/NumPy; scikit-learn

Automation/Workflow: Selenium, Power Automate, SharePoint

Auth/Connectivity: Kerberos, LDAP, ODBC, REST/JSON

DevOps/Tools: Git, GitHub/Azure DevOps (CI/CD), Docker, Linux/Windows Server, Heroku, OpenAPI/Swagger

Web: HTML, CSS, JavaScript

Soft Skills: Effective Communication, Stakeholder Collaboration, Structured Problem Solving, Planning & Prioritization, Agile Delivery, Ownership & Initiative

Professional Experience

M&T Bank

Jan 2023 – Oct 2025

Nationally respected community bank known for customer-first service and prudent risk management

Software Engineer I - Electronic Financial Crimes Investigation Unit (eFCI)

- Initiated the design of a SharePoint + Power Automate workflow to streamline BSA/AML screening; authored the architecture, built a proof-of-concept, and defined audit-trail and folder-scoped triggers
- Developed resilient Selenium crawlers for case/negative-news portals with retry/backoff and structured exports (CSV / pipe-delimited), including automated PDF generation and flattening
- Implemented structured, centralized logging and defensive error handling across tools, which sped incident triage and simplified on-call support
- Implemented SQL Server extract utilities that executed views and exported strongly typed, pipe-delimited files; validated cross-platform ODBC connectivity on Linux/Windows
- Automated routine operations with Python/Bash (via SSH)—scheduled file transfers, log monitoring/rotation, and health checks—to reduce manual toil and shorten recovery time
- Set up secure Kerberos/LDAP authentication for SQL Server and internal resources by configuring krb5.conf/keytabs, registering SPNs, and validating ODBC drivers across Linux/Windows
- Standardized configuration, logging, and exception patterns (config-driven behavior, consistent conventions), improving maintainability and reuse
- Partnered with Compliance and stakeholders to deliver products iteratively within an Agile Scrumban framework
- Authored and maintained clear and concise READMEs to streamline cross-team handoffs

Post Process Technologies

Oct 2021 – Sept 2022

Trailblazing 3D printing startup automating post-processing at an industrial scale

Software Developer

- Restructured major portions of the customer-facing web app (Angular & Node.js with MongoDB/PostgreSQL backends), simplifying navigation and reducing friction across core user flows
- Built Angular components and .NET Core APIs that expanded functionality and improved responsiveness, introducing modular patterns for easier extension
- Modeled and maintained relational (SQL Server, PostgreSQL) and document (MongoDB) data; built data access with EF Core and native drivers to improve stability and clarity
- Implemented microservices that interfaced with shop-floor machines and emitted real-time alerts to users, improving visibility into machine events
- Migrated legacy WPF code to a custom MVVM architecture to increase testability and maintainability, reducing coupling between views and business logic

FoodWeb

Jan 2021 – Oct 2021

Non-Profit Startup looking to reduce food waste by connecting restaurants to donation centers and volunteers

Software Engineer

- Modeled PostgreSQL schema and wrote stored procedures (constraints and indexes) to support core features and reliable data access
- Developed server-side REST APIs in Node.js to handle core workflows, adding input validation and structured error handling
- Built Angular components and services for key user flows, integrating API calls for a responsive, consistent UI
- Collaborated with the project lead to define application architecture and sequence deliverables; documented interfaces for smooth handoffs

University at Buffalo

Jan 2017 – Dec 2020

Teaching Assistant – under Dr. Matthew Herz

- Led recitations and office hours for Intro to Programming I & II (Java, Python, C++); authored step-by-step exercises on OOP, data structures, and algorithms
- Coached code reviews and debugging, teaching problem decomposition, testable design, and clear, well-documented code

Projects

Glassdoor Mining Project – supervised by Dr. Bina Ramamurthy

- Built a Python/Selenium pipeline to scrape 2,000+ data-scientist postings; normalized titles/skills/salary text with pandas/NumPy and published an interactive Heroku app
- Modeled salary estimates with scikit-learn regression and visualized trends by skill, geography, and pay using Matplotlib/Seaborn

Mortgage Outcomes Analysis (CFPB)

- Analyzed CFPB mortgage datasets in R, building a reproducible dplyr pipeline and ggplot2 visuals for distributions and trends
- Used linear regression to examine relationships among applicant race, income, and loan approval outcomes

Education

Bachelor of Arts in Economics,
Minor in Computer Science

University at Buffalo, Dec 2020
